Summary
This internship was a mechanical and chemical engineering internship pertaining to the pharmaceutical and labeling industries. I worked mainly in the machine shop building labelling machines for healthcare clients, such as Abbott, and in the lab testing label material for durability.

Cultural Experience
Getting the hang of the public transportation system there took me quite a while since it's much bigger than any I've traveled with in the United States. I once had three minutes to sprint through the train station in Stuttgart to make my connecting train which was, needless to say, stressful.

Relation to Your Major
HERMA has a lot of large pharmaceutical clients and therefore, does a lot of work with healthcare research and improving solutions for pharmaceutical. Furthermore, it helped me develop a base in mechanical engineering and machine building which I think is important for my major as well.
